

# POLYURETHANE CORD by REVIGLASS

REVIGLASS is committed to continuous improvement and development of new products and now, proudly presents an interesting new mounting called **POLYURETHANE CORD**.

This **POLYURETHANE CORD** consists of multiple adhesive cords of Polyurethane (PUr) which cross the back of the sheet. The chemical structure of this mounting is mono-component and contains no solvent.

The **POLYURETHANE CORD** is appropriate to use with any specific adhesives for the glass mosaic (concrete, polyurethane, epoxy, etc.) guaranteeing a perfect hold on the most difficult surfaces. Due to their exclusive composition with no solvent, the cords do not reduce gluing surface of the pieces. This advantage creates a 100% fixed surface, with no detaching risk, which guarantees a perfect hold in any installation.

The **POLYURETHANE CORD** is the perfect mounting system for the laying in any environment.

The **POLYURETHANE CORD** is suitable for use with any laying technique. Indeed, it is enough to have a simple “cutter” in order to separate the pieces. This allows manual adjustment due to its superior flexibility, comparable to that of the paper currently used.

The new **POLYURETHANE CORD** turns into the perfect mounting, bringing together the advantages of the PVC dots and the Fiberglass Mesh and solving their current weaknesses.

The **POLYURETHANE CORD** is presented in 4 sizes: 1.2x1.2cm, 2.5x2.5 cm, 3.6x3.6 cm and 5x5cm.
